CPP Problem Design

Subject: Namespace

Contributor: 謝公耀, 陳俊儒, 廖宣瑋

Main testing concept: Namespace

Basics	Functions
■ C++ BASICS	■ SEPARATE COMPILATION AND NAMESPACES
☐ FLOW OF CONTROL	☐ STREAMS AND FILE I/O
☐ FUNCTION BASICS	☐ RECURSION
☐ PARAMETERS AND OVERLOADING	☐ INHERITANCE
☐ ARRAYS	☐ POLYMORPHISM AND VIRTUAL FUNCTIONS
☐ STRUCTURES AND CLASSES	☐ TEMPLATES
☐ CONSTRUCTORS AND OTHER TOOLS	☐ LINKED DATA STRUCTURES
☐ OPERATOR OVERLOADING, FRIENDS, AND REFERENCES	☐ EXCEPTION HANDLING
☐ STRINGS	☐ STANDARD TEMPLATE LIBRARY
☐ POINTERS AND DYNAMIC ARRAYS	☐ PATTERNS AND UML

Description:

This Programming Project explores how the unnamed namespace works.

Listed below are snippets from a program to perform input validation for a username and password. The code to input and validate the username is in a separate file than the code to input and validate the password.

File header user.cpp:

```cpp
namespace Authenticate
{
  void inputUserName()
  {
      do
      {
      cout << "Enter your username (8 letters only)" << endl;
      cin >> username;
      } while (!isValid());
  }

  string getUserName()
  {
      return username;
  }
```

```
}
```

Define the username variable and the isValid() function in the unnamed
namespace so the code will compile. The isValid() function should return true
if username contains exactly eight letters. Generate an appropriate header
file for this code.

Repeat the same steps for the file password.cpp, placing the password variable
and the isValid() function in the unnamed namespace. In this case, the
isValid() function should return true if the input password has at least 8
characters including at least one non-letter:

File header password.cpp:

```cpp
namespace Authenticate
{
  void inputPassword()
  {
      do
      {
      cout << "Enter your password (at least 8 characters " <<
           "and at least one non-letter)" << endl;
      cin >> password ;
      } while (!isValid());
  }

  string getPassword()
  {
      return password;
  }
}
```

At this point you should have two functions named isValid(), each in different
unnamed namespaces.   Place the following main function in an appropriate
place. The program should compile and run.

```cpp
int main()
```

```
{
    inputUserName();

    inputPassword();

    cout << "Your username is " << getUserName() <<

            " and your password is: " <<

            getPassword() << endl;

    return 0;

}
```

Input:
username and password

Output:
username and password

Sample Input / Output：

Sample Input	Sample Output
aaa aaaaaa abcdefghi abcdefgh aaaaaaaaaa1	Enter your username (8 letters only) Enter your username (8 letters only) Enter your username (8 letters only) Enter your username (8 letters only) Enter your password (at least 8 characters and at least one non-letter) Your username is abcdefgh and your password is: aaaaaaaaaa1

☐ Eazy,Only basic programming syntax and structure are required.

■ Medium,Multiple programming grammars and structures are required.

☐ Hard,Need to use multiple program structures or complex data types.

Expected solving time:
20 minutes

Other notes:
